Intended Use

The Matriks Biotek® Q-BEVA Enzyme Immunoassay has been developed for the quantitative analysis of biologically active form of free bevacizumab (Avastin®)* in serum and plasma samples.

* Avastin® is a registered trademark of Genentech, Inc.

Summary and Explanation

Bevacizumab (Avastin®) is a recombinant human IgG1:k monoclonal antibody specific for all human vascular endothelial growth factor-A (VEGF-A) isoforms. In 1997, the humanization of the murine anti-VEGF Mab A.4.6.1. was reported. Like its murine counterpart, bevacizumab binds to and neutralizes all human VEGF-A isoforms and bioactive proteolytic fragments, but not mouse or rat VEGF. However, bevacizumab was observed to inhibit the growth of human tumor cell lines in nude mice. In addition, studies have demonstrated that bevacizumab, in combination with chemotherapy, resulted in increased survival in patients with previously untreated metastatic colorectal cancer relative to chemotherapy alone, leading to FDA approval of the first anti-angiogenic agent.

Anti-VEGF monoclonal antibodies and other VEGF inhibitors block the growth of several tumor cell lines in nude mice. Clinical trials with VEGF inhibitors in a variety of malignancies are ongoing. The humanized anti-VEGF monoclonal antibody, bevacizumab, has been approved by the FDA as a first-line treatment for metastatic colorectal cancer in combination with chemotherapy. Furthermore, VEGF is implicated in intraocular neovascularization associated with diabetic retinopathy and age-related macular degeneration. The pharmacokinetic properties of bevacizumab in several species have been previously described and are consistent with a typical humanized monoclonal antibody.

In 1997, Phase I clinical trials with bevacizumab was initiated. These Phase I studies showed that the antibody as a single agent was relatively non-toxic and that adding it to standard chemotherapy regimens did not significantly exacerbate chemotherapy-associated toxicities. In 1998, several Phase II studies were initiated with bevacizumab in different tumor types, either as a single agent or in combination with chemotherapy. bevacizumab was combined with Standard first-line chemotherapy in metastatic colorectal cancer and stage IIIb/IV non-small cell lung cancer.
The potential clinical utility of VEGF inhibition in oncology is not limited to solid tumors. There is growing evidence that VEGF and VEGF receptors are expressed by a variety of leukemias and other hematologic malignancies, suggesting that inhibition of VEGF or VEGFR signaling may have a role in the treatment of such conditions. Several clinical trials are currently testing these hypotheses.

Although bevacizumab was generally well tolerated, but some serious and unusual toxicities were noted. Some open-label Phase I and II clinical trials had identified a number of adverse events, including thrombosis and bleeding as potential bevacizumab-related toxicities. In addition, most common adverse reactions are epistaxis, headache, hypertension, rhinitis, proteinuria, taste alteration, dry skin, rectal hemorrhage, lacrimation disorder, back pain and exfoliative dermatitis.

Bevacizumab is dosed and administered up to 15 mg/kg (Non-squamous non-small cell lung cancer: 15 mg/kg IV every 3 weeks with carboplatin/paclitaxel) in patients without evidence of doselimiting toxicities. However, in case of overdosage, it is recommended that the patient be monitored for any signs or symptoms of adverse reactions or effects and appropriate treatment instituted immediately.

Serum through levels might be related to predict some clinical outcome during maintenance therapy. It was also possible that the surveillance of circulating concentration during maintenance therapy represents a direct and/or indirect factor for some other side effects. In this context, identification of biomarkers for (non-) response and risk factors for adverse drug reactions that might be related to serum drug levels and maintaining the effective minimum concentration in order to potentially avoid some side effects with a reliable method might be beneficial.

**Test Principle**

Solid phase enzyme-linked immunosorbent assay (ELISA) based on the double antigen assay principle. Diluted standards and samples (serum or plasma) are incubated in the microtitre plate coated with human vascular endothelial growth factor (VEGF). After incubation, the wells are washed. A biotin conjugated human VEGF is added and binds to bevacizumab (Avastin®) captured by the reactant on the surface of the wells. Following incubation, wells are washed and then HRP conjugated probe (HRP) is added. After incubation, the wells are washed and the bound enzymatic activity is detected by addition of chromogen- substrate. The colour developed is proportional to the amount of bevacizumab in the sample or standard. Results of samples can be determined directly using the standard curve.
Warnings and Precautions

1. For professional use only.

2. Before starting the assay, read the instructions completely and carefully. Use the valid version of the package insert provided with the kit. Be sure that everything is understood. For further information (clinical background, test performance, automation protocols, alternative applications, literature, etc.) please refer to the local distributor.

3. In case of severe damage of the kit package please contact Matriks Biotek® or your supplier in written form, latest one week after receiving the kit. Do not use damaged components in test runs, but keep safe for complaint related issues.

4. Obey lot number and expiry date. Do not mix reagents of different lots. Do not use expired reagents.

5. Follow good laboratory practice and safety guidelines. Wear lab coats, disposable latex gloves and protective glasses where necessary.

6. Reagents of this kit containing hazardous material may cause eye and skin irritations. See MATERIALS SUPPLIED and labels for details.

7. Chemicals and prepared or used reagents have to be treated as hazardous waste according the national biohazard safety guidelines or regulations.

8. Avoid contact with Stop solution. It may cause skin irritations and burns.

9. All reagents of this kit containing human serum or plasma (i.e. standards) have been tested and were found negative for HIV I/II, HBsAg and HCV. However, a presence of these or other infectious agents cannot be excluded absolutely and therefore reagents should be treated as potential biohazards in use and for disposal.

10. Some reagents contain sodium azide (NaN₃) as preservatives. In case of contact with eyes or skin, flush immediately with water. NaN₃ may react with lead and copper plumbing to form explosive metal azides. When disposing reagents, flush with large volume of water to avoid azide build-up.

Storage and Stability

The kit is shipped at ambient temperature and should be stored at 2-8°C. Keep away from heat or direct sun light. The strips of microtiter plate is stable up to the expiry date of the kit in the broken, but tightly closed bag when stored at 2–8°C.
Specimen Collection and Storage

**Serum, Plasma (EDTA, Heparin)**

The usual precautions for venipuncture should be observed. It is important to preserve the chemical integrity of a blood specimen from the moment it is collected until it is assayed. Do not use grossly hemolytic, icteric or grossly lipemic specimens. Samples appearing turbid should be centrifuged before testing to remove any particulate material.

*. Bevacizumab (Avastin®) infusion camouflages/masks the presence of antibody to bevacizumab in serum/plasma samples. Therefore, blood sampling time is critical for detection of Avastin. The Matriks Biotek® Laboratories suggests to obtain blood sample just before the infusion of bevacizumab (Avastin®) or at least 2 weeks after the infusion of bevacizumab (Avastin®).

Materials Required But Not Supplied

1. Micropipettes (Multipipette Eppendorf or similar devices, < 3% CV).
2. Calibrated measures.
3. Tubes (1 mL) for sample dilution.
4. Wash bottle, automated or semi-automated microtiter plate washing system.
5. Microtiter plate reader capable of reading absorbance at 450/650 nm.
6. Bidistilled or deionised water, paper towels, pipette tips and timer.

Procedure Notes

1. Any improper handling of samples or modification of the test procedure may influence the results. The indicated pipetting volumes, incubation times, temperatures and pretreatment steps have to be performed strictly according to the instructions. Use calibrated pipettes and devices only.
2. Once the test has been started, all steps should be completed without interruption. Make sure that required reagents, materials and devices are prepared ready at the appropriate time. Allow all reagents and specimens to reach room temperature (18-25 °C) and gently swirl each vial of liquid reagent and sample before use. Mix reagents without foaming.
3. Avoid contamination of reagents, pipettes and wells/tubes. Use new disposable plastic pipette tips for each reagent, standard or specimen. Do not interchange caps. Always cap not used vials. Do not reuse wells/tubes or reagents.
4. Use a pipetting scheme to verify an appropriate plate layout.
5. Incubation time affects results. All wells should be handled in the same order and time sequences. It is recommended to use an 8-channel Micropipettor for pipetting of solutions in all wells.
6. Microplate washing is important. Improperly washed wells will give erroneous results. It is recommended to use a multichannel pipette or an automatic microplate washing system. Do not allow the wells to dry between incubations. Do not scratch coated wells during rinsing and aspiration. Rinse and fill all reagents with care. While rinsing, check that all wells are filled precisely with Wash Buffer, and that there are no residues in the wells.
7. Humidity affects the coated wells/tubes. Do not open the pouch until it reaches room temperature. Unused wells/tubes should be returned immediately to the resealed pouch including the desiccant.
Pre-Test Setup Instructions

<td>12</td>
<td><strong>Measure</strong> optical density with a photometer at 450/650 nm within 30 min after pipetting of the Stop Solution.</td>
</tr>
</tbody>
</table>
Quality Control

The test results are only valid only if the test has been performed following the instructions. Moreover the user must strictly adhere to the rules of GLP (Good Laboratory Practice) or other applicable standards/laws. All standards must be found within the acceptable ranges as stated above and/or label. If the criteria are not met, the run is not valid and should be repeated. In case of any deviation the following technical issues should be proven: Expiration dates of (prepared) reagents, storage conditions, pipettes, devices, incubation conditions and washing methods.

Calculation & Interpretation Of Results

1. Using the diluted standards (1000; 300; 100; 30; 0 ng/mL) disregarding zero standard, construct a standard curve by plotting the OD450/650 nm for each of 4 standards on the vertical (Y-axis) axis versus the corresponding Bevacizumab concentration on the horizontal (X-axis) axis, thus creating a standard curve by 4 points obtained.

2. The concentration of the samples can be read directly from this standard curve. Using the absorbance value for each sample, determine the corresponding concentration of bevacizumab from the standard curve. Find the absorbance value on the Y-axis and extend a horizontal line to the curve. At the point of intersection, extend a vertical line to the X-axis and read the bevacizumab concentration for the unknown sample.

3. If computer data regation is going to be used, we recommend primarily "4 Parameter Logistic (4PL)" or secondly the "point-to-point calculation".

4. To obtain the exact values of the samples, the concentration determined from the standard-curve must be multiplied by the dilution factor (100x). Any sample reading greater than the highest standard should be further diluted appropriately with Assay Buffer and retested. Therefore, if the pre-diluted samples have been further diluted, the concentration determined from the standard curve must be multiplied by the further dilution factor.

   E.g.; If the pre-diluted sample further diluted in a ratio of 1:10 then results should be multiplied by 100.

5. Automated method: Computer programs can also generally give a good fit.
Typical Calibration Curve
(Example. Do not use for calculation!)

Assay Characteristics

1. **Specificity:** There is no cross reaction with native serum immunoglobulins.

2. **Sensitivity:** The lowest detectable level that can be distinguished from the zero standard is less than 30 ng/mL.

3. **Precision of Kit:**
   - **Intra-assay CV:** <15% for bevacizumab range 30-1000 ng/mL.
   - **Inter-assay CV:** <15% for bevacizumab range 30-1000 ng/mL.

4. **Recovery:** Recovery rate was found to be between 85-115% with normal human serum samples with known concentrations.

Automation

Experiments have shown that the Matriks Biotek® SHIKARI® Bevacizumab ELISA is also suitable to run on an automated ELISA processor.
